

# VECTOR-BORNE DISEASES AND BLOOD SAFETY: A EUROPEAN PERSPECTIVE

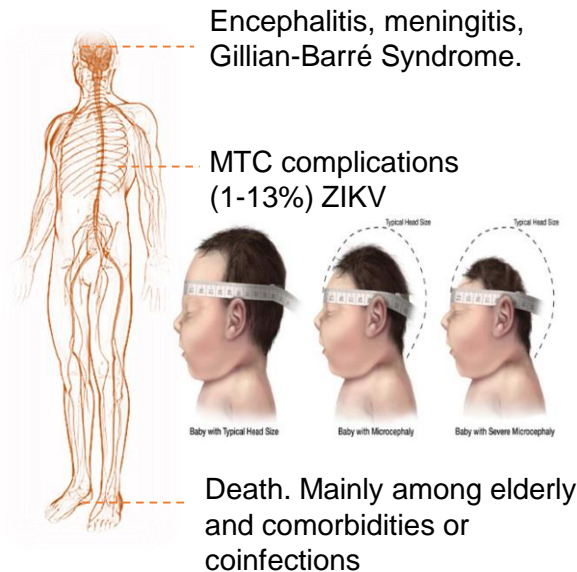

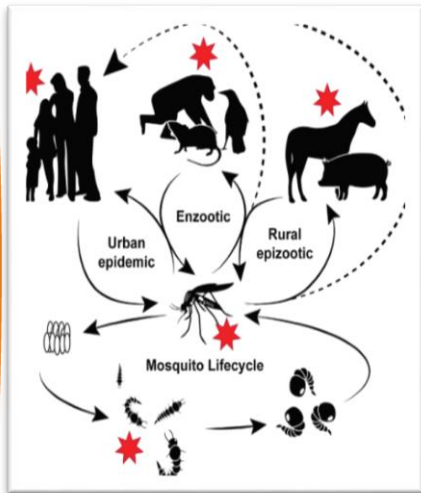

Rossana Catherine Garzón Jiménez, MSc  
Ryenne W. Lieshout-Krikke, MD PhD  
Mart P. Janssen, MSc PhD

Sanquin Research, Donor Medicine Research

## CONTENTS

- Background
- Objectives
- Methodology
- Results
- Conclusions

# ARBOVIRAL (arthropod-borne viral) INFECTIONS

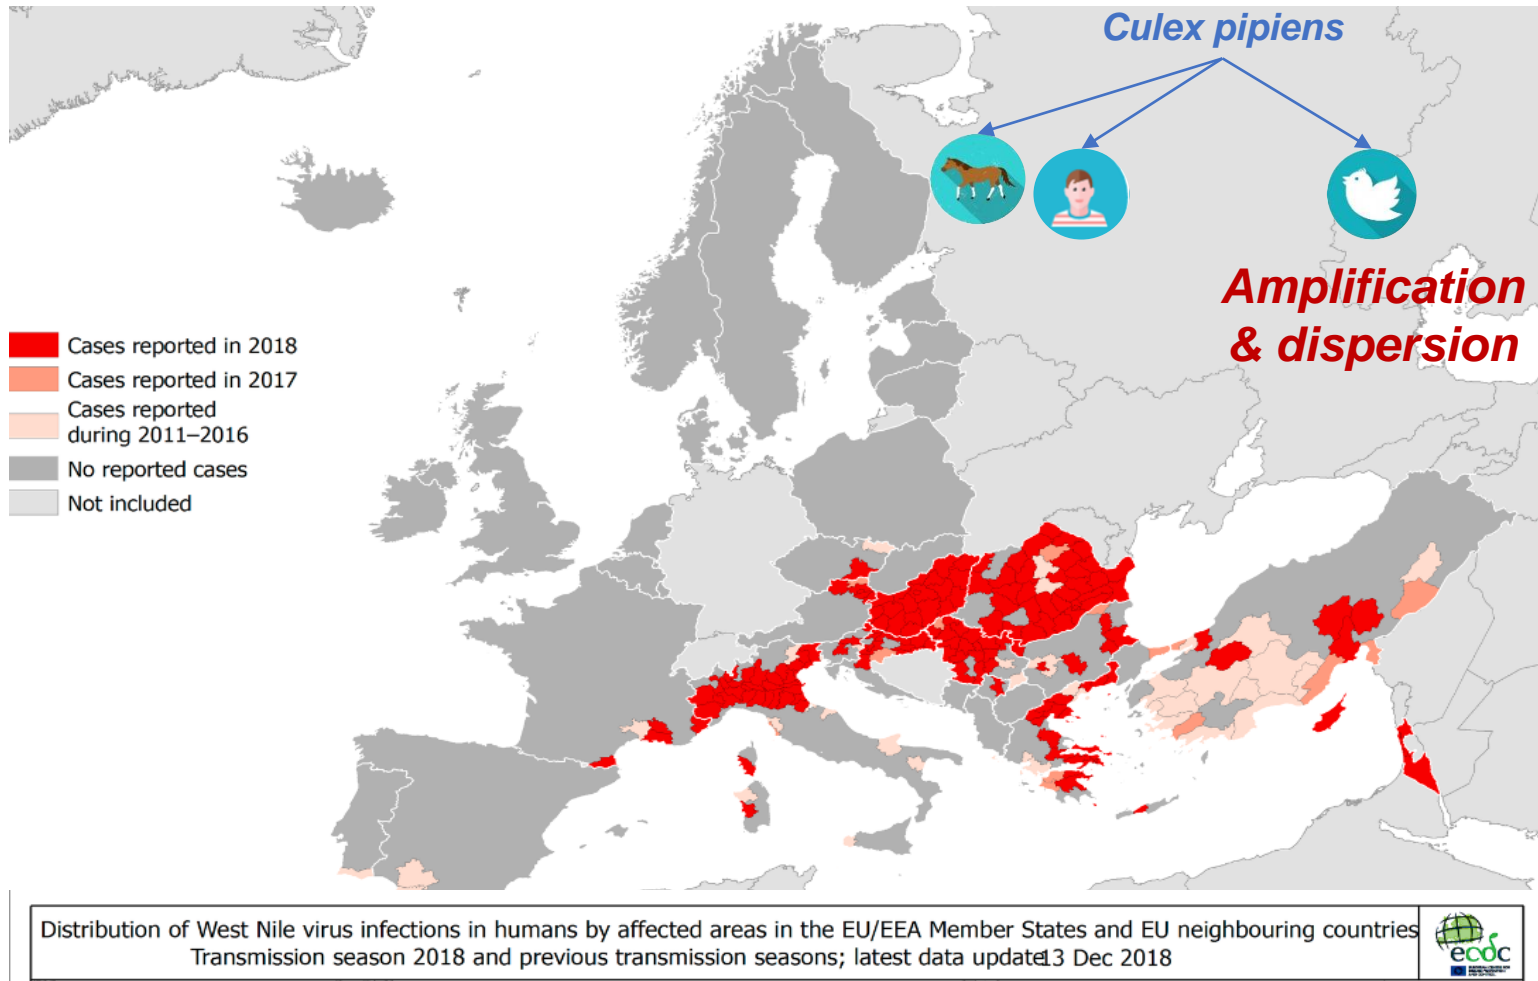

**Biological complexity** of their transmission pattern (different vectors, reservoirs)

Impact of **serious complications**

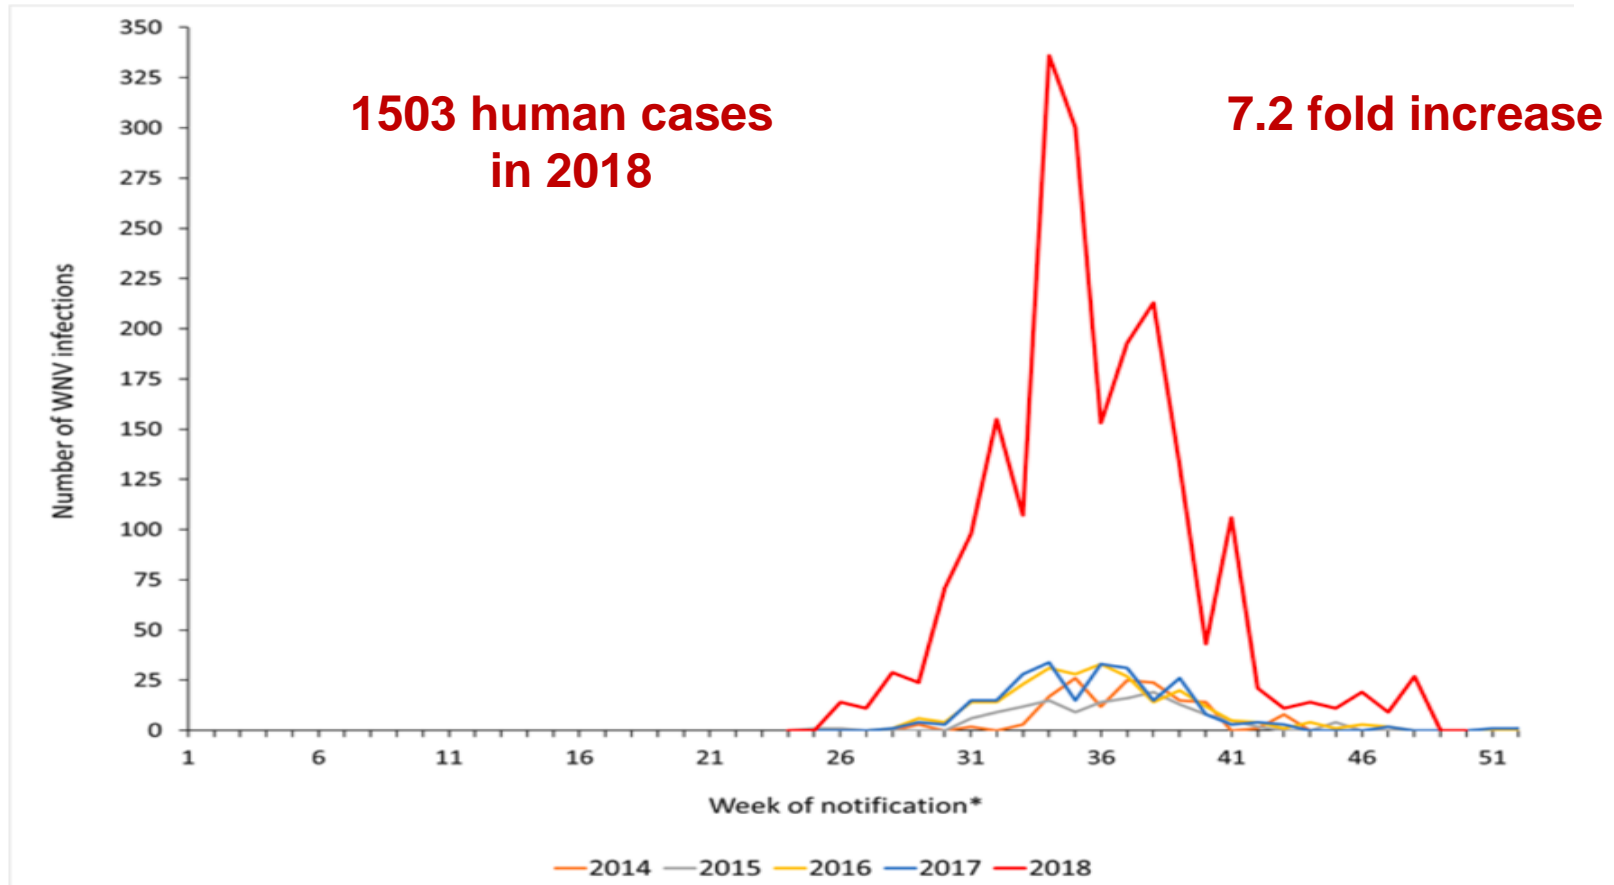

Epidemiological potential (**mobility** of infected **travellers** and establishment and **spread** of **vectors** in new areas).

# Spread of WNV in Europe

<https://ecdc.europa.eu/en/west-nile-fever/surveillance-and-disease-data/disease-data-ecdc>

Number of WNV infections in EU/EEA and EU enlargement countries by epidemiological week of notification\*, 2014-2018.

\* Week of notification to national authorities or if missing, week of notification to ECDC.

## First WNV-TT in USA (2002)

- The presence of an **asymptomatic viremic phase** (80% completely asymptomatic)
- The ability of the infectious agent to **survive in collected** and processed **blood** or components
- The ability to **cause infection** and disease through **blood transmission**.

 **15**  
symptomatic

 **13**  
meningoencephalitis

 **2**  
fever

 **7**  
deaths

# REGULATION AND RECOMMENDATIONS

## Directive 2014/110/EU

Prospective blood donors should be **deferred for 28 days** after leaving an **area with evidence of WNV circulation** among **humans** unless the results of an **individual nucleic acid test** are negative.

Application of the **same policies/ recommendations** for donors returning from areas affected by **ZIKV** and **CHIKV**.

What is the **impact** that one of these outbreaks will generate for the **European blood safety**?

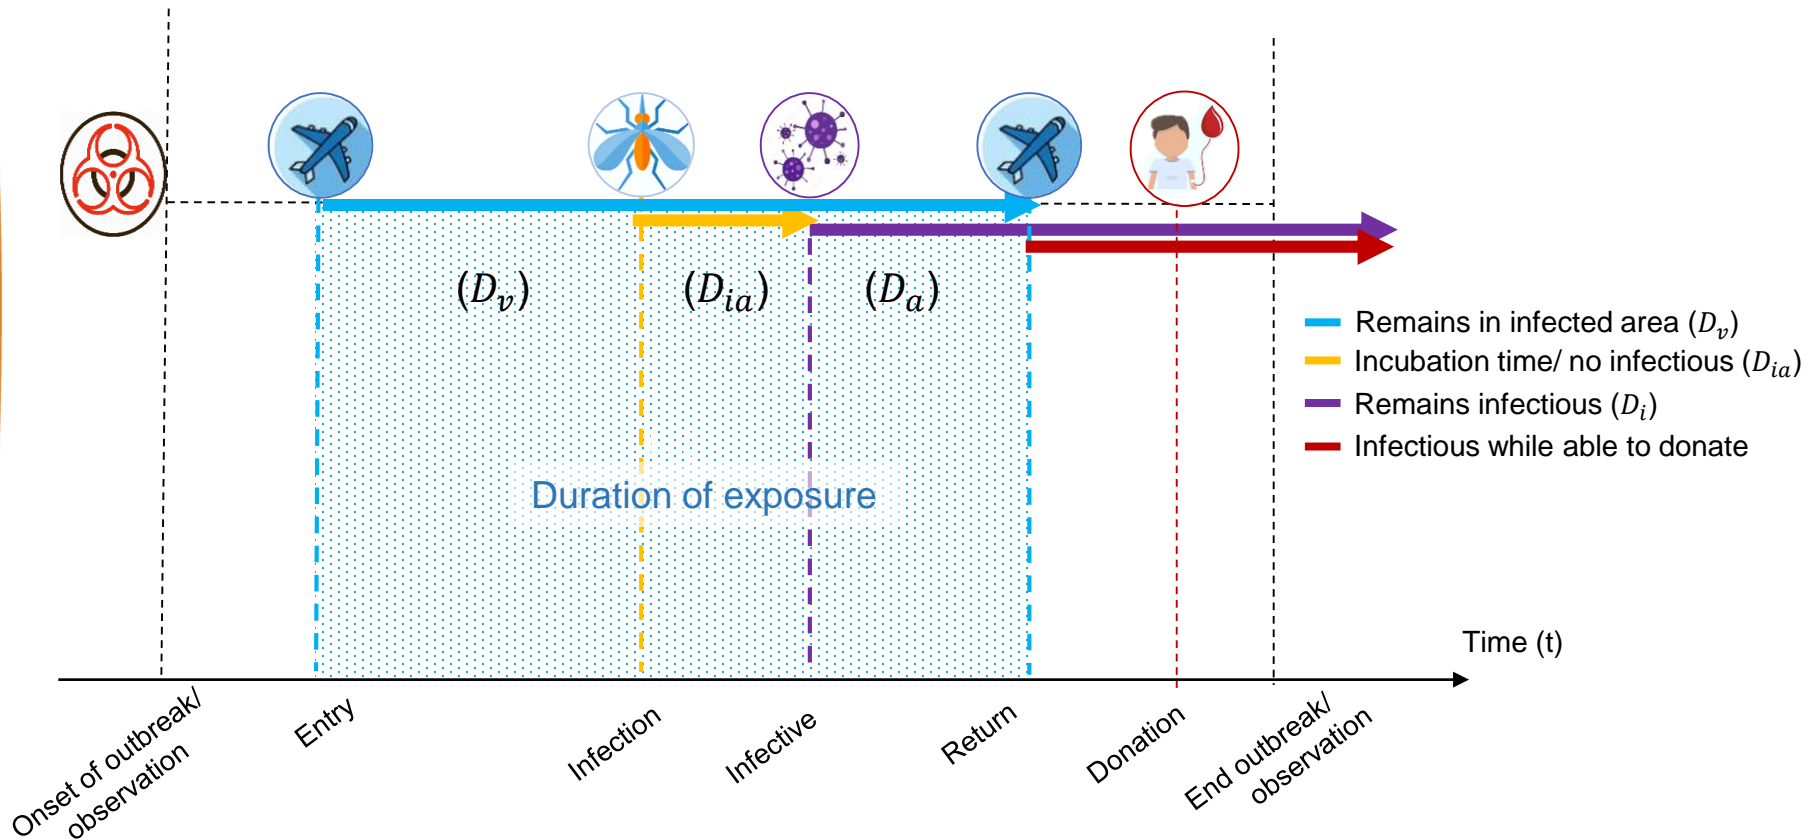

# OBJECTIVES

- 1) Estimate the **risk of emerging infection transmission throughout Europe**
- 2) Develop a **simple tool** to calculate the **combined risk of disease transmission** for outbreaks in specific countries/areas for **Europe as a whole**
- 3) Derive the number of **infections transmitted by blood transfusion throughout Europe** per observed infection in Europe ( $R_{0t}$ )
- 4) Generate an easy way to estimate the **impact of an outbreak** for the **European blood supply**

# METHODOLOGY

Number of infected blood products from travelling donors after returning to their home country.

# Conservative Estimate of the Number of Infectious Disease Transmissions by European Travelling Donors

$$n_i = \sum_j \left( \underbrace{p_{dj} \cdot \varphi_j}_{\text{donor distribution}} \cdot \underbrace{\frac{f_{v,j,i}}{N_i}}_{\text{visitors}} \cdot \underbrace{\frac{(D_a/2 + D_{ia}) \cdot D_a}{1 - p_u}}_{\text{infectivity}} \right)$$

$n_i$  = the number of infected blood products per observed infection in outbreak region  $i$

$p_{dj}$  = the **proportion of donors** of the general population in country  $j$

$\varphi_j$  = the number of **blood product distributed** per donor per day country  $j$

$f_{v,j,i}$  = the number of **visitors per day** to the outbreak region  $i$  from country  $j$

$N_i$  = the number of **inhabitants** in the **outbreak region**  $i$

$D_a$  = the **duration of infectivity** of an infected donor (days)

$D_{ia}$  = the **length of time** it takes for a donor to **become infectious** (days)

$p_u$  = the proportion of **unobserved infections**

Risk model

European Up-Front Risk Assessment Tool (EUFRAT)

$$n_i = \sum_j \left( p_{dj} \cdot \varphi_j \cdot \frac{f_{v j,i}}{N_i} \right) \cdot \frac{(D_a/2 + D_{ia}) \cdot D_a}{1 - p_u}$$

140 observed infections required for one infected blood product in Europe

5 observed infections required for one infected blood product in Europe

**140 NI cases required for one WNV infected blood product by a travelling donor in Europe**

Given the characteristics of the European blood supplies and travels within Europe, in order to have **one infected blood product of WNV in Europe** would be necessary on average **7016 observed WNV infections**, or **140 neuro-invasive cases** of WNV infection

# Risk of Infectious Disease Transmission by European Travelling Donors

	Unique outbreak in Greece		Multiple outbreaks	Outbreak in Europe
	Risk for Greece	Risk for Europe	Risk for Europe	Risk for Europe
Estimated number of transmissions per observed <b>NI infection</b>	0.28	0.0082	0.0036	0.0071
Estimated number of <b>NI infections</b> required for one infected blood product	4	122	279	140
Estimated number of transmissions per observed <b>non-NI infection</b>	0.0057	0.00016	0.000071	0.00014
Estimated number of <b>non-NI infections</b> required for one infected blood product	176	6114	13992	7016

## CONCLUSION

- **Risk models** can provide **estimates** based on a limited number of variables only, providing a **framework for blood safety** decision-making.
- The risk of transmission of infections by blood from travelling donors of the arboviruses considered (presuming that these would indeed be transmitted) are comparable in size and **require thousands of infections** to attain **one transfusion transmission**.
- **Local risk of transmission** of the arboviruses considered by blood transfusion are **more than an order of magnitude higher** than the **cumulative risk for the whole European blood supply**, even when this risk is conservatively estimated
- These **risk ratios** provided may **vary per country**, and are most strongly influenced by the nations **travelling habits**

Thank you!
